Chapter 3

AGGREGATE DEMAND II: BUILDING THE IS-LM MODEL ADAPTED

CONTEXT

- Chapter 1 introduced the model of aggregate demand and supply.
- Chapter 2 developed the *IS-LM* model, the basis of the aggregate demand curve.

IN THIS CHAPTER, YOU WILL LEARN...

- how to use the *IS-LM* model to analyze the effects of shocks, fiscal policy, and monetary policy
- how to derive the aggregate demand curve from the *IS-LM* model
- several theories about what caused the Great Depression

EQUILIBRIUM IN THE IS-LM MODEL

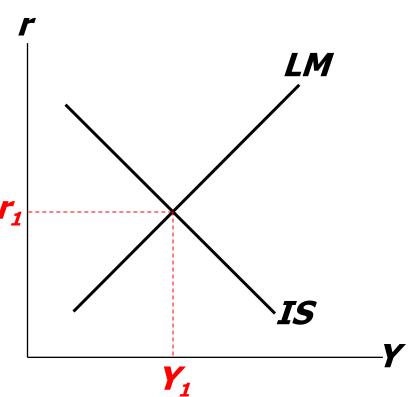

The *IS* curve represents equilibrium in the goods market.

$$Y = C(Y - T) + I(r) + G$$

The *LM* curve represents money market equilibrium.

$$\bar{M}/\bar{P}=L(r,Y)$$

The intersection determines the unique combination of **Y** and **r** that satisfies equilibrium in both markets.

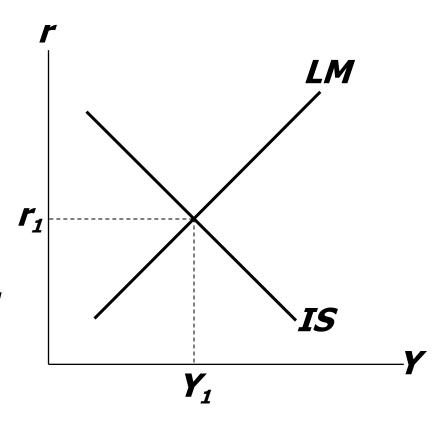

POLICY ANALYSIS WITH THE IS-LM MODEL

$$Y = C(Y - T) + I(r) + G$$

$$\bar{M}/\bar{P} = L(r, Y)$$

We can use the *IS-LM* model to analyze the effects of

- fiscal policy: G and/or T
- monetary policy: *M*

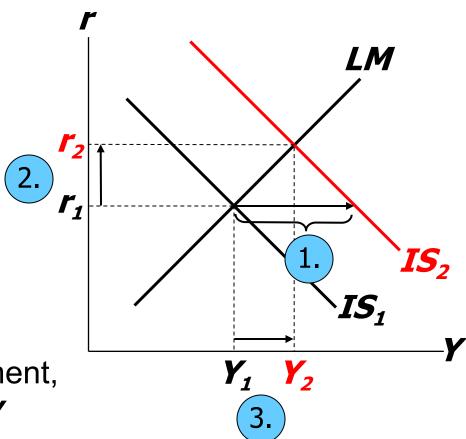

AN INCREASE IN GOVERNMENT PURCHASES

1. IS curve shifts right

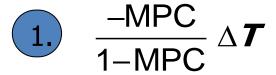

by
$$\frac{1}{1-\text{MPC}} \Delta \boldsymbol{G}$$
 causing output & income to rise.

- 2. This raises money demand, causing the interest rate to rise...
- 3. ...which reduces investment, so the final increase in \mathbf{Y} is smaller than $\frac{1}{\sqrt{1000}}\Delta\mathbf{G}$

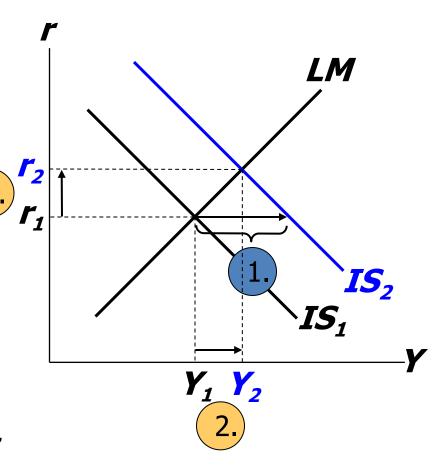

A TAX CUT

Consumers save (1-MPC) of the tax cut, so the initial boost in spending is smaller for ΔT than for an equal ΔG ... and the *IS* curve shifts by

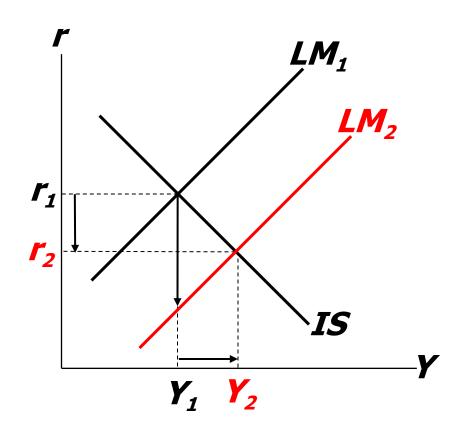

2. ...so the effects on r and Y are smaller for ΔT than for an equal ΔG .

Monetary policy: An increase in M

- 1. $\Delta M > 0$ shifts the LM curve down (or to the right)
- 2. ...causing the interest rate to fall
- 3. ...which increases investment, causing output & income to rise.

INTERACTION BETWEEN MONETARY & FISCAL POLICY

• Model:

Monetary & fiscal policy variables (M, G, and T) are exogenous.

- Real world:
 - Monetary policymakers may adjust *M* in response to changes in fiscal policy, or vice versa.
- Such interaction may alter the impact of the original policy change.

The Fed's response to $\Delta G > 0$

- Suppose Congress increases *G*.
- Possible Fed responses:
 - **1.** hold *M* constant
 - 2. hold r constant
 - 3. hold Y constant
- In each case, the effects of the ΔG are different:

Response 1: Hold M constant

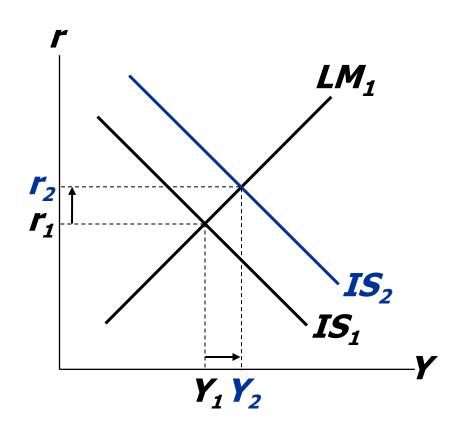

If Congress raises *G*, the *IS* curve shifts right.

If Fed holds **M** constant, then *LM* curve doesn't shift.

Results:

$$\Delta \boldsymbol{Y} = \boldsymbol{Y}_2 - \boldsymbol{Y}_1$$

$$\Delta r = r_2 - r_1$$

RESPONSE 2: HOLD R CONSTANT

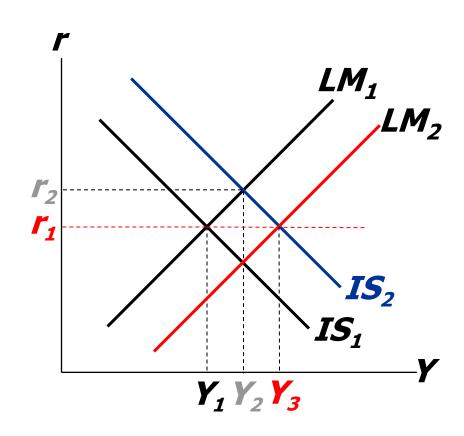

If Congress raises *G*, the *IS* curve shifts right.

To keep *r* constant, Fed increases *M* to shift *LM* curve right.

Results:

$$\Delta Y = Y_3 - Y_1$$

$$\Delta r = 0$$

RESPONSE 3: HOLD Y CONSTANT

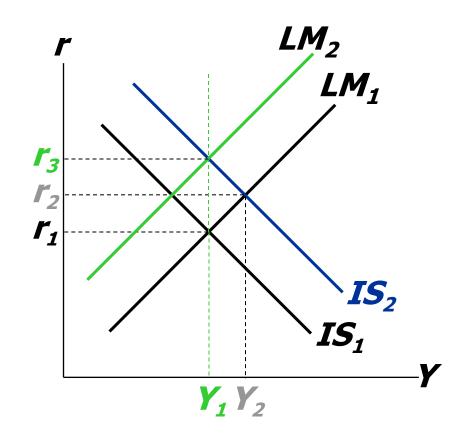

If Congress raises *G*, the *IS* curve shifts right.

To keep **Y** constant, Fed reduces **M** to shift *LM* curve left.

Results:

$$\Delta Y = 0$$

$$\Delta r = r_3 - r_1$$

ESTIMATES OF FISCAL POLICY MULTIPLIERS

$from\ the\ DRI\ macroeconometric\ model$

Assumption about monetary policy	Estimated value of $\Delta Y/\Delta G$	Estimated value of $\Delta Y/\Delta T$
Fed holds money supply constant	0.60	-0.26
Fed holds nominal interest rate constant	1.93	-1.19

SHOCKS IN THE IS-LM MODEL

IS shocks: exogenous changes in the demand for goods & services.

Examples:

- stock market boom or crash
 - ⇒ change in households' wealth
 - $\Rightarrow \Delta C$
- change in business or consumer confidence or expectations
 - $\Rightarrow \Delta I$ and/or ΔC

SHOCKS IN THE IS-LM MODEL

LM shocks: exogenous changes in the demand for money.

Examples:

- a wave of credit card fraud increases demand for money.
- more ATMs or the Internet reduce money demand.

EXERCISE: ANALYZE SHOCKS WITH THE IS-LM MODEL

Use the *IS-LM* model to analyze the effects of

- 1. a boom in the stock market that makes consumers wealthier.
- 2. after a wave of credit card fraud, consumers using cash more frequently in transactions.

For each shock,

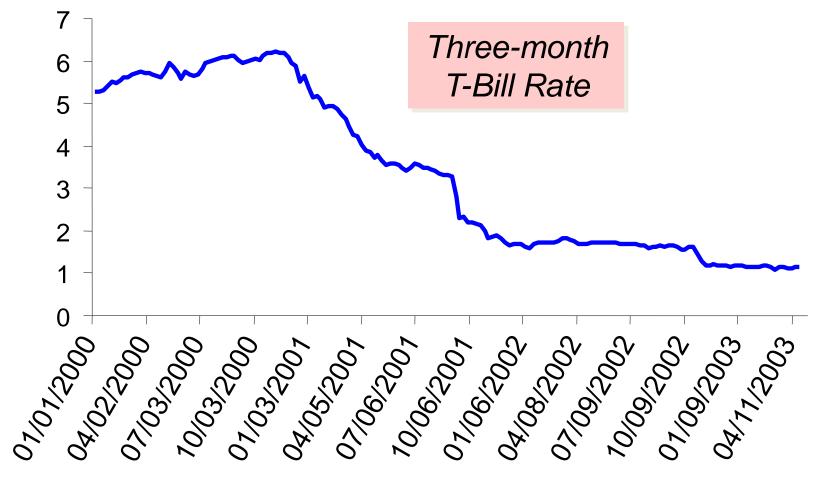

- **a.** use the IS-LM diagram to show the effects of the shock on Y and r.
- **b.** determine what happens to C, I, and the unemployment rate.

- During 2001,
 - 2.1 million people lost their jobs, as unemployment rose from 3.9% to 5.8%.
 - GDP growth slowed to 0.8% (compared to 3.9% average annual growth during 1994-2000).

- Causes: 1) Stock market decline $\Rightarrow \downarrow C$
- Causes: 2) 9/11
 - increased uncertainty
 - fall in consumer & business confidence
 - result: lower spending, IS curve shifted left
- Causes: 3) Corporate accounting scandals
 - Enron, WorldCom, etc.
 - reduced stock prices, discouraged investment

- Fiscal policy response: shifted IS curve right
 - tax cuts in 2001 and 2003
 - spending increases
 - oairline industry bailout
 - •NYC reconstruction
 - Afghanistan war

• Monetary policy response: shifted *LM* curve right

WHAT IS THE FED'S POLICY INSTRUMENT?

- The news media commonly report the Fed's policy changes as interest rate changes, as if the Fed has direct control over market interest rates.
- In fact, the Fed **targets** the *federal funds rate* the interest rate banks charge one another on overnight loans.
- The Fed changes the money supply and shifts the *LM* curve to achieve its target.
- Other short-term rates typically move with the federal funds rate.

WHAT IS THE FED'S POLICY INSTRUMENT?

Why does the Fed target interest rates instead of the money supply?

- 1) They are easier to measure than the money supply.
- 2) The Fed might believe that *LM* shocks are more prevalent than *IS* shocks. If so, then targeting the interest rate stabilizes income better than targeting the money supply. (See end-of-chapter Problem 7 on p.328.)

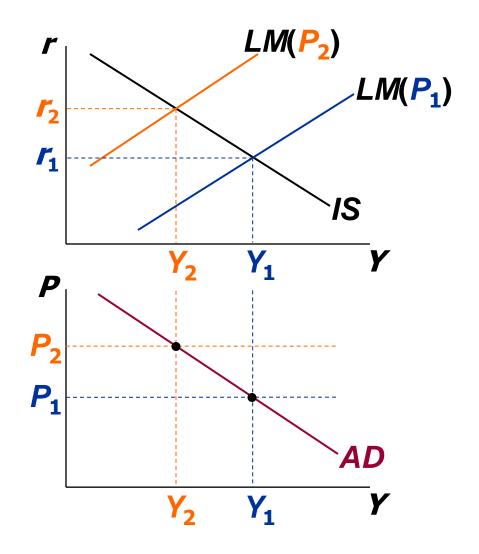

IS-LM AND AGGREGATE DEMAND

- So far, we've been using the *IS-LM* model to analyze the short run, when the price level is assumed fixed.
- However, a change in P would shift LM and therefore affect Y.
- The **aggregate demand curve** (*introduced in Chap. 9*) captures this relationship between **P** and **Y**.

Deriving the AD curve

Intuition for slope of *AD* curve:

$$\uparrow P \Rightarrow \downarrow (M/P)$$
 $\Rightarrow LM \text{ shifts left}$
 $\Rightarrow \uparrow r$
 $\Rightarrow \downarrow I$
 $\Rightarrow \downarrow Y$

Monetary policy and the AD curve

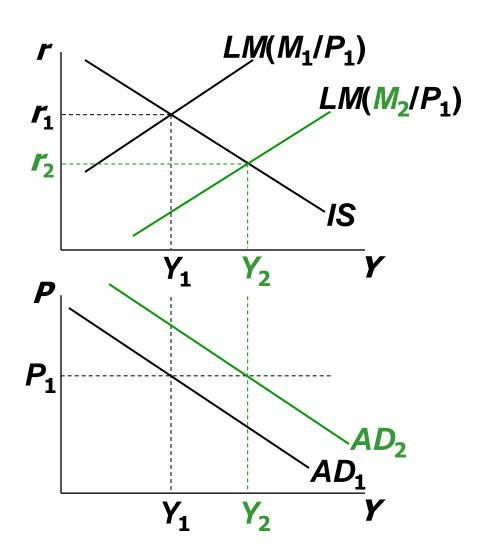

The Fed can increase aggregate demand:

 $\uparrow M \Rightarrow LM$ shifts right

$$\Rightarrow \downarrow r$$

$$\Rightarrow \uparrow I$$

⇒ ↑ **Y** at each value of **P**

FISCAL POLICY AND THE AD CURVE

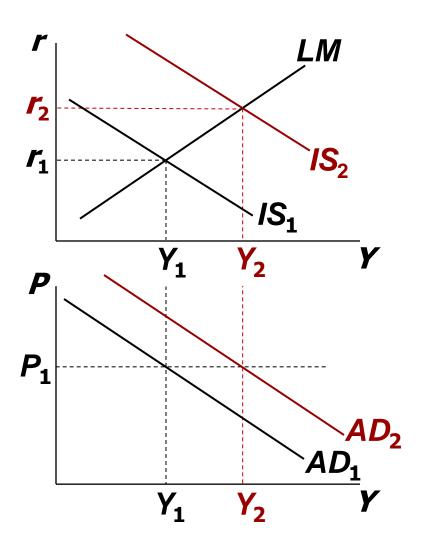

Expansionary fiscal policy ($\uparrow G$ and/or $\downarrow T$) increases agg. demand:

$$\downarrow \mathbf{7} \Rightarrow \uparrow \mathbf{C}$$

$$\Rightarrow IS \text{ shifts right}$$

$$\Rightarrow \uparrow \mathbf{V} \text{ at each}$$

 $\Rightarrow \uparrow Y$ at each value of P

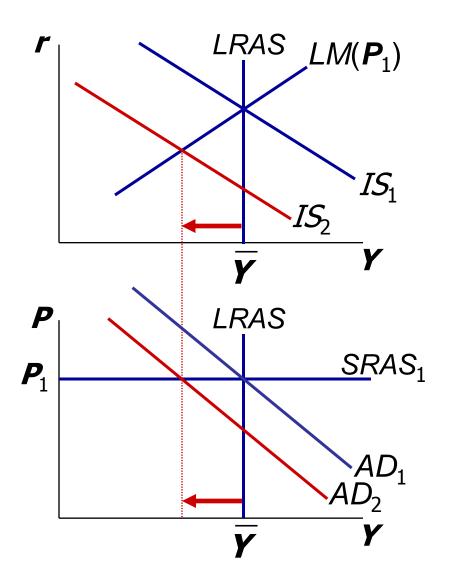

IS-LM and AD-AS In the short run & long run

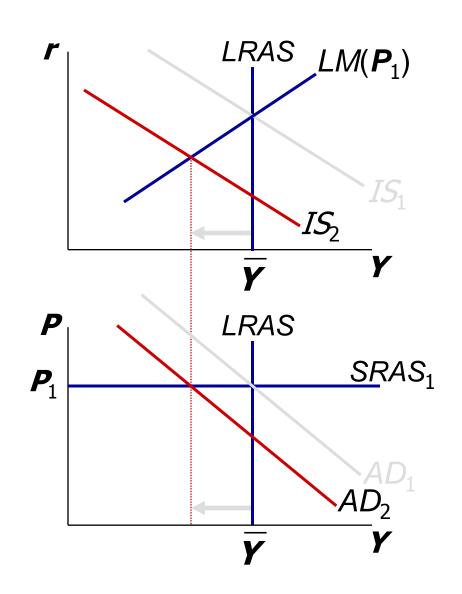

<u>Recall from Chapter 2</u>: The force that moves the economy from the short run to the long run is the gradual adjustment of prices.

In the short-run equilibrium, if	then over time, the price level will	
Y > Y	rise	
$Y < \overline{Y}$	fall	
$Y = \overline{Y}$	remain constant	

A negative IS shock shifts IS and AD left, causing Y to fall.

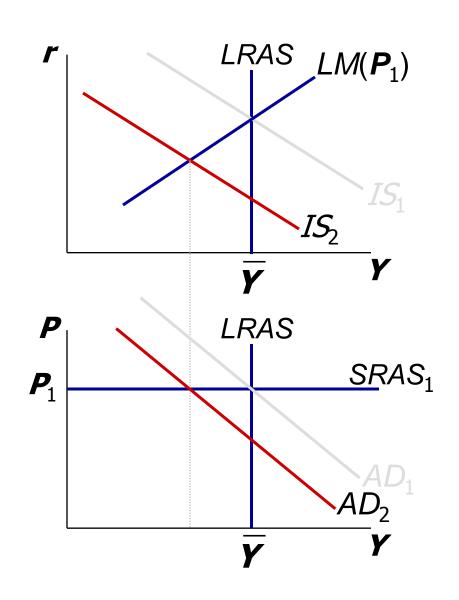

In the new short-run equilibrium, $Y < \overline{Y}$

In the new short-run equilibrium, $Y < \overline{Y}$

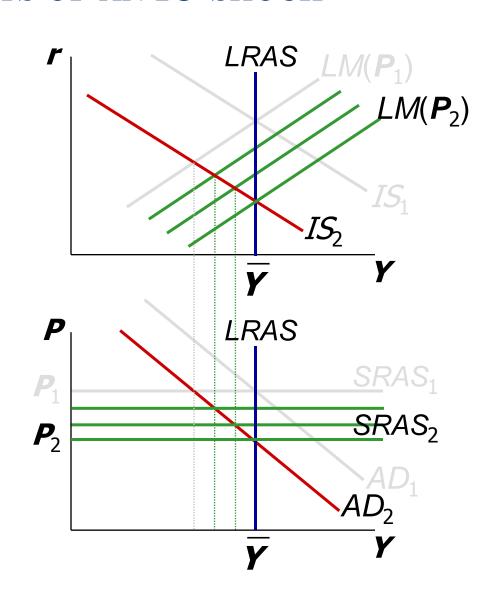

Over time, **P** gradually falls, which causes

- SRAS to move down.
- M/P to increase, which causes LM to move down.

Over time, **P** gradually falls, which causes

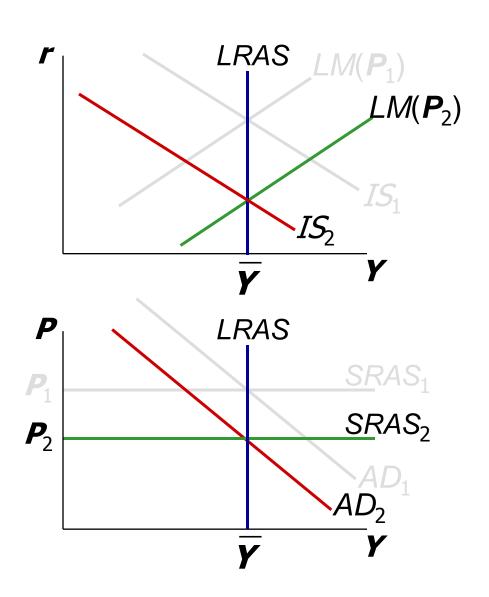

- SRAS to move down.
- M/P to increase, which causes LM to move down.

The SR and LR effects of an IS shock

This process continues until economy reaches a long-run equilibrium with

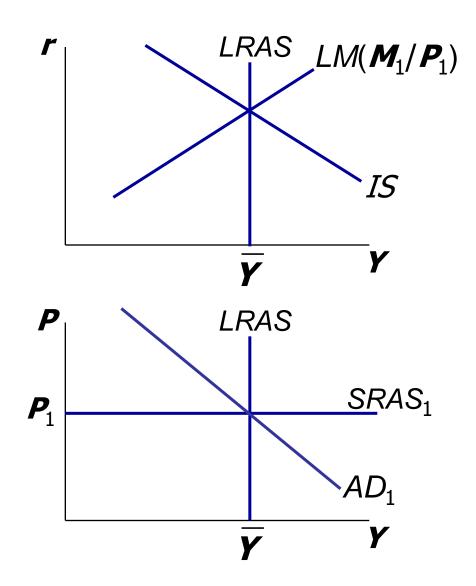

$$m{Y} = \overline{m{Y}}$$

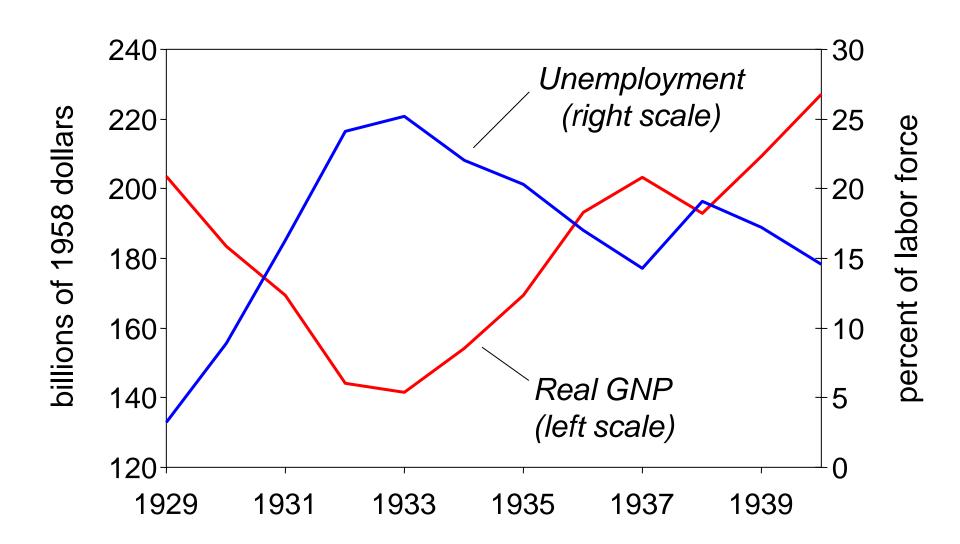

EXERCISE:

Analyze SR & LR effects of ΔM

- a. Draw the *IS-LM* and *AD-AS* diagrams as shown here.
- b. Suppose Fed increases *M*. Show the short-run effects on your graphs.
- c. Show what happens in the transition from the short run to the long run.
- d. How do the new long-run equilibrium values of the endogenous variables compare to their initial values?

THE GREAT DEPRESSION

THE SPENDING HYPOTHESIS: SHOCKS TO THE *IS* CURVE

- asserts that the Depression was largely due to an exogenous fall in the demand for goods & services
 a leftward shift of the *IS* curve.
- evidence: output and interest rates both fell, which is what a leftward *IS* shift would cause.

THE SPENDING HYPOTHESIS: REASONS FOR THE *IS* SHIFT

- Stock market crash \Rightarrow exogenous $\downarrow C$
 - Oct-Dec 1929: S&P 500 fell 17%
 - Oct 1929-Dec 1933: S&P 500 fell 71%
- Drop in investment
 - "correction" after overbuilding in the 1920s
 - widespread bank failures made it harder to obtain financing for investment
- Contractionary fiscal policy
 - Politicians raised tax rates and cut spending to combat increasing deficits.

THE MONEY HYPOTHESIS: A SHOCK TO THE *LM* CURVE

- asserts that the Depression was largely due to huge fall in the money supply.
- evidence: *M*1 fell 25% during 1929-33.
- But, two problems with this hypothesis:
 - P fell even more, so M/P actually rose slightly during 1929-31.
 - nominal interest rates fell, which is the opposite of what a leftward *LM* shift would cause.

• asserts that the severity of the Depression was due to a huge deflation:

P fell 25% during 1929-33.

- This deflation was probably caused by the fall in M, so perhaps money played an important role after all.
- In what ways does a deflation affect the economy?

- The stabilizing effects of deflation:
- $\circ \downarrow P \Rightarrow \uparrow (M/P) \Rightarrow LM \text{ shifts right} \Rightarrow \uparrow Y$
- Pigou effect:

$$\downarrow P \qquad \Rightarrow \uparrow (M/P) \\
\Rightarrow \text{consumers' wealth } \uparrow \\
\Rightarrow \uparrow C \\
\Rightarrow IS \text{ shifts right} \\
\Rightarrow \uparrow Y$$

• The destabilizing effects of <u>expected</u> deflation:

```
\downarrow \pi^{e}
```

- $\Rightarrow r \uparrow$ for each value of *i*
- $\Rightarrow \mathbf{I} \downarrow \text{ because } \mathbf{I} = \mathbf{I}(r)$
- \Rightarrow planned expenditure & agg. demand \downarrow
- \Rightarrow income & output \downarrow

- The destabilizing effects of <u>unexpected</u> deflation: **debt-deflation theory**
- $\downarrow P$ (if unexpected)
 - ⇒ transfers purchasing power from borrowers to lenders
 - ⇒ borrowers spend less, lenders spend more
 - ⇒ if borrowers' propensity to spend is larger than lenders', then aggregate spending falls, the *IS* curve shifts left, and *Y* falls

Why another Depression is unlikely

- Policymakers (or their advisors) now know much more about macroeconomics:
 - The Fed knows better than to let M fall so much, especially during a contraction.
 - Fiscal policymakers know better than to raise taxes or cut spending during a contraction.
- Federal deposit insurance makes widespread bank failures very unlikely.
- Automatic stabilizers make fiscal policy expansionary during an economic downturn.

CHAPTER SUMMARY

- 1. IS-LM model
 - a theory of aggregate demand
 - exogenous: M, G, T, P exogenous in short run, Y in long run
 - endogenous: r, Y endogenous in short run, P in long run
 - IS curve: goods market equilibrium
 - LM curve: money market equilibrium

CHAPTER SUMMARY

2. AD curve

- shows relation between P and the IS-LM model's equilibrium Y.
- negative slope because $\uparrow P \Rightarrow \downarrow (M/P) \Rightarrow \uparrow r \Rightarrow \downarrow I \Rightarrow \downarrow Y$
- expansionary fiscal policy shifts *IS* curve right, raises income, and shifts *AD* curve right.
- expansionary monetary policy shifts *LM* curve right, raises income, and shifts *AD* curve right.
- IS or LM shocks shift the AD curve.
